

## 116. Start using energy efficient lighting

*Save energy using efficient lighting by [sa.gov.au](http://sa.gov.au)*

Make the big switch to energy efficient light bulbs in your restaurant. You will not only save up to \$22 per bulb per year, but this wise move can also add up to quite a savings over time by chipping away at your electricity bills.

## 117. Don't need lights yet? Keep them off

Make it a habit to keep lights off when they're not needed. You might also want to try intelligent lighting that will automatically turn lights off when an area is bright enough and doesn't need to be lit yet.

## 118. Turn down the thermostat

During the colder months, turning your thermostat down by a degree or two can make a lot of difference in your energy costs. If you can still be comfortable turning it down from 72 to 70 degrees, then this shouldn't be a problem.
