

The safer, more economical solution to cleaning oils and greases off mechanical parts and tools

AlSCO offer a complete Managed Rental Service for the EcoSafe Washer.

As industries become aware of the environment and have the need for safer workplaces, best practices are moving towards new products like the water-based tools and parts washers.

The AlSCO EcoSafe Washer uses a water-based fluid to convert oils and greases into water and carbon dioxide. This process is called bioremediation and is completely natural. This ensures a safer workplace, providing you peace-of-mind to clean parts and tools without breathing in harmful vapours or soaking your hands in dangerous hydrocarbons (solvent-based washers).

Quite simply our EcoSafe Washer is the safer and sustainable solution to washing greasy parts and tools.

Safer for you

Not only does it clean just as effectively as a solvent-based washer, it is a non-toxic alternative. The EcoSafe Washer cleans brakes and parts without damaging rubber seals, and is a kinder solution to the skin, reducing skin irritations, like dermatitis.

Sustainable solution

The EcoSafe washer uses the bioremediation process, which is 100% natural. It involves microorganisms feeding on the grease and oil which separates from the fluid, converting it to water and minimal carbon dioxide.
